

Access ACS SOAP API Agreement

The Access ACS SOAP Application Programming Interface (API) is and is intended for development with Access ACS data. **The API has no security filters** and allows you to do the following things:

- use Web services to access your data from the Access ACS™ and/or Facility Scheduler databases
- validate ACS users
- pulls member contact information into an application you created for Outlook or a phone app
- create a custom report or application
- send modified data to your ACS database. Data changes from the API will be received back via the ACS change request process.

The API may be used by developers at another software solution. Your organization can then provide them your ACST site number and the SecID to allow access to the data within that product.

If you're considering development with the [Access ACS SOAP API](#), please review all documentation available.

Reason for Request	

Acknowledgements

I understand that the API will allow me to access my ACS® data. ACS Technologies will provide email assistance to help guide me on how to use these applications. Any custom development would require an evaluation of my needs; additional fees may be incurred.

By requesting read and write capability:

- ✓ I release ACS Technologies Group, Inc. from any damage or other data problems that may arise outside of the normal use of ACS software.
- ✓ I am aware that without proper systems and security in place, I may make my data vulnerable.
- ✓ I realize that ACS Technologies will continue to provide software support for the normal use of the ACS software in accordance with the maintenance agreement that I currently have on record.
